INTRODUCTION

Halfway through the timeframe for achieving the Millennium Development Goals (MDG), progress on MDG 3—to promote gender equality and women's empowerment—has been mixed. There have been notable gains for women and girls in education and political participation since 2000, when the world committed to the MDGs. But in other areas, progress lags or cannot be assessed. With seven years until the 2015 deadline for achieving these goals, how can the world ensure success?

To achieve MDG 3 action is needed to strengthen women's capabilities, opportunities and security. From 2002 to 2005, ICRW co-chaired the U.N. Millennium Project Task Force 3 for Education and Gender Equality, which recommended seven strategic priorities that focus on education, health, infrastructure, employment, property ownership, political participation and reductions in violence. The task force also proposed 12 indicators to measure progress on these priorities (see Box 1).

Data analysis of the indicators shows that clear progress has been made in enhancing women's capabilities, especially in education and increasing women's political representation in national parliaments and local governments. But much more needs to be done. Improvements in employment and women's reproductive health have lagged. Progress cannot be measured because of limited or nonexistent data in several areas such as ownership of assets; unpaid work burdens resulting from inadequate provision of water, energy and transportation; and violence against women.¹

The enormous social and economic contributions that women make to the development process are central to achieving all the MDGs. The spirit of MDG 3 requires fundamental transformation in the distribution of power, opportunities and outcomes for both men and women, along with adequate financial resources to implement the interventions necessary for such transformation. This brief assesses progress toward MDG 3 by analyzing changes in the 12 indicators proposed by the task force and offers recommendations that can redouble global efforts to fulfill this worthy goal.

THE U.N. MILLENNIUM PROJECT TASK FORCE 3 FOR EDUCATION AND GENDER EQUALITY RECOMMENDED SEVEN STRATEGIC PRIORITIES AND 12 INDICATORS FOR GENDER EQUALITY AND WOMEN'S EMPOWERMENT.**

1. Strengthen Opportunities for Postprimary Education for Girls

GOOD PROGRESS

Indicator 1: Ratio of female to male gross enrollment rates in primary, secondary and tertiary education **Indicator 2:** Ratio of female to male completion rates in primary, secondary and tertiary education

2. Guarantee Sexual and Reproductive Health and Rights

SLOW PROGRESS

Indicator 3: Adolescent fertility rate

Indicator 4: Proportion of contraceptive demand satisfied

3. Invest in Infrastructure to Reduce Women's and Girls' Time Burdens

INSUFFICIENT DATA

Indicator 5: Hours per day (or year) women and men spend fetching water and collecting fuel

4. Guarantee Women's Property and Inheritance Rights

INSUFFICIENT DATA

Indicator 6: Land ownership by sex (male, female or jointly held)
Indicator 7: Housing title by sex (male, female or jointly held)

5. Reduce Gender Inequality in Employment

SLOW PROGRESS

Indicator 8: Gender differences in the structure of employment

Indicator 9: Gender gaps in earnings in wage employment and self-employment

6. Increase Women's Representation in Political Bodies

SOME PROGRESS

Indicator 10: Percentage of seats held by women in national parliament **Indicator 11:** Percentage of seats held by women in local government bodies

7. Combat Violence against Women

INSUFFICIENT DATA

Indicator 12: Prevalence of domestic violence

^{*} U.N. Millennium Project 2005. Taking Action: Achieving Gender Equality and Empowering Women. Task Force on Education and Gender Equality. New York: Earthscan Publications.

^{**} The United Nations General Assembly adopted these priorities in 2005. However, the U.N. has not yet set benchmarks for assessing progress toward these priorities. As a result, they are not reflected in official U.N. reports on the Millennium Development Goals.

STRATEGIC PRIORITY 1:

STRENGTHEN OPPORTUNITIES FOR POSTPRIMARY EDUCATION

Postprimary education is associated with low fertility and child mortality, and reduced vulnerability to HIV and AIDS.² The task force emphasized postprimary education because "secondary and higher levels of education have the greatest payoff for women's empowerment, enhancing women's own health, economic opportunities, positions in their families and political participation."³

INDICATOR 1: Ratio of female to male gross enrollment rates in primary, secondary and tertiary education

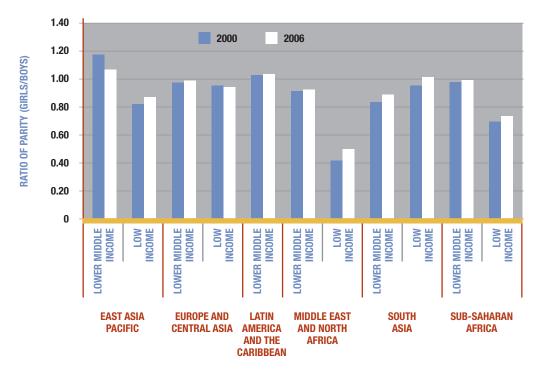

INDICATOR 2: Ratio of female to male completion rates in primary, secondary and tertiary education

Primary education represents the first step in the education pipeline. The good news is gender disparities in primary enrollment and completion ratios have been substantially reduced, especially among low and lower middle income countries in sub-Saharan Africa and South Asia.

But gaps persist. Low female to male primary enrollment ratios remain in some low income countries in sub-Saharan Africa. In Chad, Democratic Republic of the Congo, Cote d'Ivoire, Mali and Niger, less than eight girls are enrolled for every 10 boys (see Appendix Table 1). In the Middle East and North Africa, low income countries (Djibouti, Morocco, Sudan and Yemen) improved female primary enrollment rates but still lag behind low income countries in other regions. Moreover, low primary completion rates for both boys and girls exist in low and lower middle income countries in South Asia, lower middle income countries in sub-Saharan Africa, and upper and lower middle income countries in the Middle East and North Africa (see Appendix Table 2).

Most countries achieved gender parity in secondary education enrollment in 2005. But gender parity ratios were below .90 in 34 low and lower middle income countries in sub-Saharan Africa, East Asia Pacific, Middle East and North Africa, and South Asia (see Figure 1). Reverse gender gaps—fewer boys than girls—in secondary enrollment persist in 23 countries in Latin America, 12 countries in East Asia, and seven countries in the Middle East and North Africa, a worrisome trend that should be monitored. Progress toward gender parity in secondary completion cannot be assessed because data do not exist.⁴

5

Note: Country classification used in this brief follows that used by the World Bank where economies are divided by geographic regions as well as according to 2007 GNI per capita, calculated using the World Bank Atlas method. The income groups are: low income, \$935 or less; lower middle income, \$936-\$3,705; upper middle income, \$3,706-\$11,455; and high income, \$11,456 or more.

Policies that have reduced the cost of schooling for poor households through scholarships for girls, cash transfers and fee waivers can be credited for much of the success achieved in increasing girls' access to primary and secondary schooling. However, gender parity in access is only the first step. Achieving numerical parity between males and females is not sufficient because it can be achieved by lowering the bar for all. To strengthen opportunities for postprimary education by 2015, retention and educational quality also must be addressed.

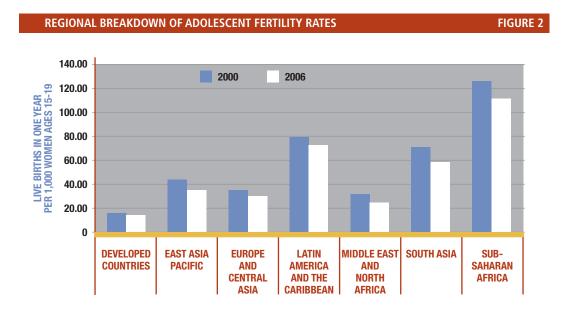

STRATEGIC PRIORITY 2:

GUARANTEE SEXUAL AND REPRODUCTIVE HEALTH AND RIGHTS

To ensure the health of women, children and families, women must be guaranteed universal access to sexual and reproductive health services. The task force recommended tracking progress on this strategic priority by measuring adolescent fertility rates and the proportion of contraceptive demand satisfied, which combines unmet need and contraceptive prevalence.⁵

INDICATOR 3: Adolescent fertility rate

Adolescent fertility rates have decreased globally over the past decade. But in low and lower middle income countries, adolescent fertility rates remain high when compared to developed countries, where the fertility rate hovers at 12.08.6 All low and middle income countries in developing regions had higher adolescent fertility rates ranging from 14.32 in upper middle income countries in the Middle East and North Africa to a high of 119.41 for low income countries in sub-Saharan Africa (see Figure 2). In some parts of the developing world, such as South Asia, a large proportion of adolescent fertility occurs within marriage, highlighting the need to increase age at marriage to reduce adolescent fertility rates. In addition, provision of adolescent-friendly reproductive health services and age-appropriate sexuality education should be scaled up in the next seven years to help reduce adolescent births.

Source: World Development Indicators (WDI), 2008 database

INDICATOR 4: Proportion of contraceptive demand satisfied

Data on contraceptive demand reveal a bleak scenario. In all low and lower middle income countries across developing country regions, the proportion of contraceptive demand satisfied is low at .85 or below (see Table 1).⁷ The lowest rates are in low income countries in the Middle East and North Africa followed closely by low income countries in sub-Saharan Africa and low and lower middle income counties in Latin America and the Caribbean. Priority must be accorded in the next seven years to assuring availability and affordability of contraceptive supplies.

CONTRACEPTIVE DEMAND SATISFIED

| REGION* | NO. OF COUNTRIES | UNMET NEED (TOTAL %) | CONTRACEPTIVE PREVALENCE RATES (TOTAL %) | CONTRACEPTIVE DEMAND SATISFIED (TOTAL %) |
|------------------------------------|---------------------|-------------------------|--|--|
| Developed Countries | | | | |
| High Income | 5 | 7.7 | 73.7 | 91 |
| East Asia Pacific | | | | |

The income groups are: low income, \$935 or less; lower middle income, \$936-\$3,705; upper middle income, \$3,706-\$11,455; and high income, \$11,456 or more.

^{*}Data for some subregional income groupings were not available.

INSUFFICIENT DATA

STRATEGIC PRIORITY 3:

INVEST IN INFRASTRUCTURE TO REDUCE WOMEN'S AND GIRLS' TIME BURDENS

Investments in infrastructure are a strategic priority because the lack of adequate energy, water and sanitation facilities, and transportation systems results in a far greater time burden on women than on men. Gender-based norms assign women primary responsibility for collecting firewood and fetching water and restrict their access to motorized transportation, which in turn limits their ability to go to school and participate in income-earning or civic activities.

INDICATOR 5: Hours per day (or year) women and men spend fetching water and collecting fuel

Many countries have invested in large-scale infrastructure projects. However, few countries have collected the data to track how those investments impact women's and men's time use in chores such as water or firewood collection. The task force recommended that countries with severe infrastructure deficits use hours per day (or year) that females and males spend fetching water or collecting fuel as the indicator for tracking whether infrastructure investments reduce women's time burdens.

Only a few low and lower middle income countries have collected time-use data. Between 1995 and 2003, nine countries in Africa, eight in East Asia Pacific, three in South Asia, 16 in Europe and Central Asia, nine in Latin America and the Caribbean, and 22 developed countries conducted at least one time-use survey. Since 2003, nine developing countries have implemented a time-use survey: one in Latin America, one in East Asia, three in Africa, and four in Europe and Central Asia (see Appendix Table 3).8 This represents a hopeful start but mechanisms need to be put in place to collect such data regularly and in many more countries.

STRATEGIC PRIORITY 4:

GUARANTEE WOMEN'S PROPERTY AND INHERITANCE RIGHTS

Property and assets are key tools to gaining economic security and earning higher incomes, and there is growing recognition of the importance of assets for women's empowerment.

INDICATOR 6: Land ownership by sex (male, female or jointly held)

INDICATOR 7: Housing title by sex (male, female or jointly held)

Efforts to track progress on women's ownership of land and housing are hampered by a lack of data on individual ownership of these productive assets. For this reason, the task force recommended that one U.N. agency develop and lead a global effort to standardize individual level data collection on asset ownership. This has not happened.

The task force also recommended collecting individual asset ownership data through the Living Standard of Measurement Study (LSMS), which is supported by the World Bank and currently collects information on assets, mostly at the household level. For instance, a recent review of LSMS surveys found that in Latin America, only seven LSMS surveys collect individual-level information on land ownership and 10 surveys collect information on housing ownership. In East Asia and the Pacific, of eight surveys, only one collects individual-level information on land ownership, and three surveys collect information on housing. Of 13 surveys in Europe and Central Asia, only one collects individual-level information on land, and two collect information on housing (see Table 2). It is hoped that the World Bank and other donors will invest in assisting a substantial number of LSMS surveys to incorporate modules on individual asset ownership within the next five years.

STRATEGIC PRIORITY 5:

REDUCE GENDER INEQUALITY IN EMPLOYMENT

Women's work, both paid and unpaid, is crucial to the survival and security of poor households and an important route by which households escape poverty. Paid employment is crucial to women's empowerment.

INDICATOR 8: Gender differences in the structure of employment

More women participate in employment now than ever before, reflecting the growth in economic opportunities available to them. Women's share of nonagricultural employment has stayed the same or risen in all regions from 2000 to 2006 (see Appendix Table 4). Yet in most countries around the world, females face inferior employment opportunities relative to males, which is why the task force focused on informal employment, wages and occupational segregation to track progress.

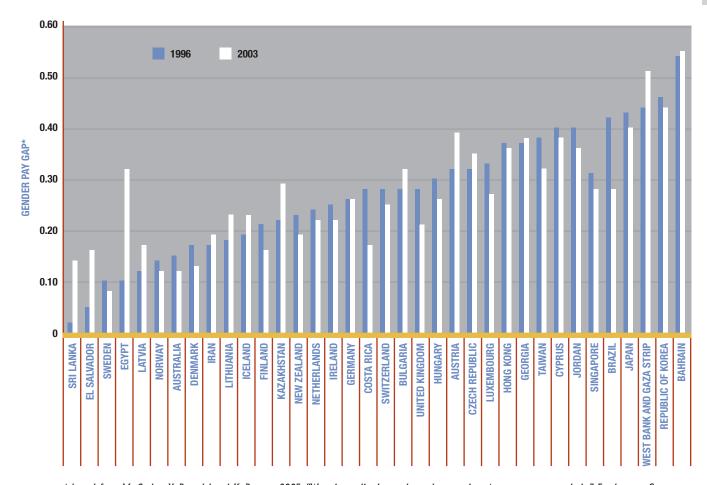

Unfortunately, time series evidence on the female share of informal employment does not exist for most countries. Nonetheless, cross-sectional evidence since 2000 indicates that informal employment—which does not usually provide job security, benefits or adequate income—continues to represent a larger share of women's employment than men's.¹⁰ Given data limitations, it is impossible to track progress toward reducing sex segregation, both across and within occupations, which is related to women's low wages and women's reliance on informal employment.

INDICATOR 9: Gender gaps in earnings in wage employment and self-employment

Gender wage gaps have risen in some parts of the world and fallen in others, according to data from the International Labour Organization (ILO) and various household surveys on female and male earnings. Many forces underlie the changes in gender wage gaps, from globalization to direct and indirect discrimination to differences in female education and labor market shifts. Nonetheless, research shows that gender gaps remain even after controlling for education, age and labor market experience.

In many developed countries, wage gaps narrowed as women's educational attainment and labor market experience improved. Relative wages for women compared with men appear to have risen in several countries in Latin American and the Caribbean, with the exception of Honduras, Jamaica and Venezuela. In several countries in Eastern Europe and Central Asia, wage gaps in manufacturing have increased largely because of labor market conditions that worsened during the transition to market economies (see Figure 3).

13

Adapted from M. Corley, Y. Perardel and K. Popova. 2005. "Wage inequality by gender and occupation: A cross-country analysis." Employment Strategy Papers. International Labour Office. Page 19. Based on data from Key Indicators of the Labor Market Table 17a.

^{*}On a scale of 0 to 1 where 0 corresponds to complete wage equality.

Although more countries now include questions on informal employment and the informal sector in their labor force surveys, one notable area of progress, gaps in data impede efforts to track progress on women's overall status in employment. ¹¹ The task force recommended using the gender differences in the structure of employment, an indicator based on a cross-classification of formal and informal employment, agricultural and nonagricultural employment, and status in employment (see Box 2 for this framework). However, lack of resources prevents development of data for this indicator. ¹² This shortfall should be a priority for donors and countries in the next five years.

| E OF | WOMEN | MEN | |
|-------|---|--------|--------|
| | | | |
| 0 | Share in total employment (both sexes = 100.0 %) | % | % |
| 1 | Total Employment | 100.0% | 100.0% |

SOME PROGRESS

STRATEGIC PRIORITY 6:

INCREASE WOMEN'S REPRESENTATION IN POLITICAL BODIES

Ensuring that women can participate in decision making in all political arenas on equal footing with men is crucial for meeting MDG 3.

INDICATOR 10: Percentage of seats held by women in national parliament

Overall, the number of women represented in national parliaments has increased in most countries. The adoption of quotas and increased global pressure are largely responsible for the increase in women's representation.

However, progress has been idiosyncratic. In 2000, only nine countries had 30 percent or more of their parliamentary seats held by women, the target set by governments at the Fourth Women's World Conference in Beijing in 1995. Today, only 20 countries have women in 30 percent or more of seats in parliament (see Appendix Table 5). Of the 20 countries, 11 are in the developed world, six are in sub-Saharan Africa and three are in Latin America and the Caribbean. The largest gains were made in sub-Saharan Africa; Rwanda achieved close to 50 percent representation of women in 2003.

INDICATOR 11: Percentage of seats held by women in local government bodies

Increasingly, women are gaining political power at the local level. For the first time, data are available to estimate female participation as elected representatives at the local government level. Costa Rica has the largest representation: Females hold 73 percent of all local government seats. But women's local political participation is evident across regions. In Peru, El Salvador, Ecuador, Bangladesh and Pakistan, females comprise about one-fourth of all local councilors; approximately one-third in South Africa, Ghana, Uganda, India, Latvia, Bolivia, Nicaragua and Colombia; and about one-half in Chile and Guatemala, according to data produced by United Cities and Local Government (see Appendix Table 6).

STRATEGIC PRIORITY 7:

COMBAT VIOLENCE AGAINST WOMEN

Violence against women has serious health and development impacts and is a gross violation of women's rights. Its continued existence is fundamentally at odds with MDG 3.

INDICATOR 12: Prevalence of domestic violence

Too few countries regularly collect data on the prevalence of violence against women to assess progress on this strategic priority. Nonetheless, available data show that levels of domestic violence are unconscionably high worldwide (see Appendix Table 7). In sub-Saharan Africa, the prevalence of domestic violence ever experienced by women ranges from 26.6 percent in Malawi to 70.9 percent in Ethiopia. India and Bangladesh report similarly high prevalence rates, 37.2 percent and 57.5 percent, respectively. In Latin America, the rate of violence against women is highest in Peru followed by Brazil. In East Asia, Thailand and Samoa report prevalence rates of 44.25 and 46.1, respectively. The developed countries also report high prevalence rates, ranging from 8 percent in Canada to between 21 percent to 23 percent in the U.S., Netherlands and Germany to 30 percent in New Zealand, Australia and Finland.

Efforts have increased to collect national data using standard definitions and methodologies. Such efforts include a project in 10 countries, ¹⁴ supported by the World Health Organization, and a growing number of Demographic Health Surveys with a standard domestic violence module. Data collection with standardized rigorous methodologies has increased the credibility of domestic violence statistics.

Despite the current lack of comprehensive data, the problem of domestic violence has energized and expanded the international movement to end violence against women and in some countries, such as India, resulted in new legislative protections. These efforts must continue.

17

CALL TO ACTION

Gender inequality is a problem that has a solution. As seen in the notable gains in education and women's political participation, a combination of commitment, resources and action will produce results. To achieve MDG 3, women need traction on all seven strategic priorities outlined here. Now is the time to increase the pace of progress on these priorities, which will require action in four key areas:

POLICY PRIORITIES: The United Nations must take the next step to act on the General Assembly's adoption of the seven strategic priorities recommended by the task force by setting benchmarks and adopting the recommended indicators for each strategic priority. The U.N. is to be commended for the recent adoption of targets and indicators for sexual and reproductive health. Within the next year, it should follow suit for the other priorities.

RESEARCH AND DATA: The U.N. system and member countries must prioritize investments in regular sex-disaggregated data collection on time use, employment, asset ownership and intimate partner violence. The ILO should accelerate and expand its efforts with member countries to measure gender earnings gaps and gender differences in informal employment; the WHO should work with countries to expand routine data collection on violence against women; and the World Bank should work with country governments to incorporate a module on individual-level asset ownership in the Living Standard of Measurement Study surveys.

FINANCING: Low income countries need external development assistance to finance investments in gender equality and women's empowerment. Financing needed beyond what households and national governments can provide to meet gender equality objectives in low income countries was about \$8.6 billion in 2006, and it averages about \$13 billion per year until 2015.¹⁵

From 2004 to 2005, donors invested \$7 billion for gender equality, leaving a financing gap of about \$1.6 billion in that year. ¹⁶ It is feasible to fill this gap. For example, Spain increased its contributions to the MDG Achievement Fund managed by UNDP, and multiple donor countries contributed to the World Bank to implement the Gender Action Plan. In addition, the Dutch government recently announced a new fund to promote progress toward MDG 3. But more efforts are needed to overcome the financial constraints to meeting MDG 3.

Donor countries that have not yet fulfilled commitments from the Monterrey Financing for Development conference¹⁷ to allocate 0.7 percent of gross domestic product (GDP) to official development assistance should do so within the next year, as this will cover both the gender equality and the MDG financing gap. Donor countries also should work with recipient governments to ensure that full funding is allocated for interventions that promote gender equality.

National governments need to translate the rhetoric of gender equality in national planning and strategies into real financing. Domestic resource mobilization is crucial for targeted public investment that promotes gender equality. Governments can mobilize more domestic resources by reforming and implementing gender-equitable tax laws and tax administrations that are capable of generating sufficient revenue to meet the MDGs including Goal 3; re-examining reserve requirements; and aligning trade, industrial and investment policies to promote employment-centered economic growth.¹⁸

ACCOUNTABILITY: The U.N. should establish a high-level agency for gender equality and women's empowerment headed by an under-secretary general with expanded authority and funding. Such an agency should combine the program and operational functions of UNIFEM with the policy and norms-setting function of the division for the advancement of women.

- ⁴ UNESCO has begun testing data collection for lower secondary graduates, but these data are not yet validated for publication. UNESCO expects to introduce graduation data collection for the upper secondary level in 2009.
- ⁵ In 2007, the MDG monitoring framework was revised to include four new targets agreed by member states at the 2005 World Summit (resolution adopted by the General Assembly A/RES/60/1). One of those targets is to achieve by 2015 universal access to reproductive health—as recommended by the U.N. Millennium Project. The U.N. system adopted this recommendation by including four new indicators for tracking progress: (1) contraceptive prevalence rate, (2) unmet need for family planning, (3) adolescent fertility rate, and (4) antenatal care coverage.
- ⁶ A useful benchmark for progress on adolescent fertility rates is the region that has the lowest adolescent fertility rate. In 2006, developed countries had the lowest average adolescent fertility rate at 12.08. Although the developed countries have the lowest adolescent fertility rate, many of these countries seek to lower it further.
- Proportion of contraceptive demand satisfied is measured by taking the contraceptive prevalence rate as a proportion of the sum of the contraceptive prevalence rate and the unmet need for family planning. It thus measures the proportion of all women of reproductive age whose demand for contraception is actually satisfied, which the more common unmet need measure does not. (U.N. Millennium Project. 2005. *Taking Action: Achieving Gender Equality and Empowering Women*. Task Force on Education and Gender Equality. New York: Earthscan Publications. page 60.)
